Aim :- Write a SQL query to implement views and triggers

Objective :- To learn about virtual tables in the database and also PLSQL constructs

Theory:

SQL Views:

In SQL, a view is a virtual table based on the result-set of an SQL statement.

A view contains rows and columns, just like a real table. The fields in a view are fields from one or more real tables in the database.

You can add SQL statements and functions to a view and present the data as if the data were coming from one single table.

A view is created with the CREATE VIEW statement.

CREATE VIEW syntax

CREATE VIEW view name AS

SELECT column1, column2, ...

FROM table name

WHERE condition;

SQL Updating a View

A view can be updated with the CREATE OR REPLACE VIEW statement.

SQL CREATE OR REPLACE VIEW Syntax

CREATE OR REPLACE VIEW view name AS

SELECT column1, column2,...

FROM table name

WHERE condition;

SQL Dropping a View

A view is deleted with the DROP VIEW statement.

SQL DROP VIEW syntax

DROP VIEW view name;

Trigger: A trigger is a stored procedure in the database which automatically invokes whenever a special event in the database occurs. For example, a trigger can be invoked when a row is inserted into a specified table or when certain table columns are being updated.

Syntax:

```
create trigger [trigger name]
```

```
[before after] {insert
```

```
update delete} on [table
```

```
name] [for each row]
```

```
[trigger body]
```

Explanation of syntax:

1. create trigger [trigger name]: Creates or replaces an existing trigger with the trigger name.
2. [before after]: This specifies when the trigger will be executed.
3. {insert update delete}: This specifies the DML operation.
4. on [table name]: This specifies the name of the table associated with the trigger.
5. [for each row]: This specifies a row-level trigger, i.e., the trigger will be executed for each row being affected.
6. [trigger_body]: This provides the operation to be performed as trigger is fired

Implementation:

SQL View:

1) Create View:

```
CREATE VIEW EmployeeInfo AS
SELECT EmployeeID, FirstName, LastName, Department, Position
FROM Employees;
SELECT * FROM EmployeeInfo;
```

✓	7	11:46:40	CREATE VIEW EmployeeInfo AS SELECT EmployeeID, FirstName, LastName, Department, Position FROM Emplo...
✓	8	11:47:59	SELECT * FROM EmployeeInfo LIMIT 0, 1000

Vidyavardhini's College of Engineering and Technology

Department of Artificial Intelligence & Data Science

22 • **SELECT * FROM EmployeeInfo;**

Result Grid					
		Filter Rows:		Export:	Wrap Cell Content:
	EmployeeID	FirstName	LastName	Department	Position
▶	1	John	Doe	Sales	Sales Representative
	2	Jane	Smith	Marketing	Marketing Manager
	3	Alice	Johnson	HR	HR Coordinator
	4	Bob	Williams	Finance	Financial Analyst
	5	Emily	Brown	IT	Software Developer

2) Drop View:

```
DROP VIEW IF EXISTS EmployeeInfo;  
SELECT * FROM EmployeeInfo;
```

✓	9	11:52:00	DROP VIEW IF EXISTS EmployeeInfo	0 row(s) affected
✗	10	11:52:15	SELECT * FROM EmployeeInfo LIMIT 0, 1000	Error Code: 1146. Table 'office_management.employeeinfo' doesn't exist

SQL Trigger:

```
-- Create Trigger to update last_updated timestamp  
DELIMITER //  
CREATE TRIGGER capitalize_name_before_insert  
BEFORE INSERT ON Employees  
FOR EACH ROW  
BEGIN  
    SET NEW.FirstName = CONCAT(UPPER(SUBSTRING(NEW.FirstName, 1, 1)), LOWER(SUBSTRING(NEW.FirstName, 2)));  
    SET NEW.LastName = CONCAT(UPPER(SUBSTRING(NEW.LastName, 1, 1)), LOWER(SUBSTRING(NEW.LastName, 2)));  
END;  
//  
DELIMITER ;  
INSERT INTO Employees (EmployeeID, FirstName, LastName, Department, Position)  
VALUES (6, 'ronaldo', 'messi', 'Sales', 'Ceo');
```

Result Grid						
		Filter Rows:		Edit:	Export/Import:	Wr
	EmployeeID	FirstName	LastName	Department	Position	last_updated
	2	Jane	Smith	Marketing	Marketing Manager	2024-04-20 12:01:37
	3	Alice	Johnson	HR	HR Coordinator	2024-04-20 12:01:37
	4	Bob	Williams	Finance	Financial Analyst	2024-04-20 12:01:37
	5	Emily	Brown	IT	Software Developer	2024-04-20 12:01:37
	6	Ronaldo	Messi	Sales	Ceo	2024-04-20 12:13:15
*	NULL	NULL	NULL	NULL	NULL	NULL

Conclusion:

1. Brief about the benefits for using views and triggers.

Ans.: Views simplify queries, enhance security, abstract table structures, and optimize performance. Triggers enforce data integrity, audit changes, enforce business logic, and support replication.

2. Explain different strategies to update views.

Ans.: Updating views can be done directly, by updating base tables, using triggers, or by recreating views. These methods offer varying degrees of control and are applied based on the view's complexity and update requirements.
